Blacknose dace

Physical Characteristics

Area - 25 acres
Average depth - 5 feet
Maximum depth - 12 feet

Temperatures:
Surface - 75⁰F
29 feet - 73⁰F

Principal fishery: Brook trout

First Pelletier Brook Lake is a small, spring-fed trout pond with sufficient dissolved oxygen at all depths in late summer. As surface water warms, spring inflow is crucial to providing sufficient cold water to sustain the trout population.

The trout fishery in the lake is maintained entirely by natural spawning in spring seepages and gravelly areas within the pond. Conservative fishing regulations have been implemented to maintain and enhance the sport fishery.

Two-wheel drive access to the pond is via improved private gravel roads maintained by industrial landowners for forest management purposes. Watercraft must be hand-carried a short distance from the road to the lake.
